# Zombieland
Course Project

Abstract *Following an explosion of secret U.S. government laboratories, fast and fearless living beings have invaded the planet and have a thirst for human blood. Few survivors are hiding in a secret place but they are starting to run out victuals. A "brave" has been designated to collect some victuals. To assist him in this task, we implemented a simulator that will help him to take into account all the possible unexpected events. Indeed, zombies have been studied for a while so we can precisely tell you how they move and behave...*

The game

The room the brave has to enter in contains food, medicine and packs of three bullets. He can kill a zombie with one bullet and can only leave the room if he has collected a certain number of objects (i.e. food + medicine). Our simulator has four arguments : the map of the room, the number of bullets he has with him at the beginning, the percentage of the objects in the room he has the collect and the number of zombies in the room (default values are used if the user does not precise any value).

Percentage of objects If this percentage is smaller than 0 (resp. bigger than 100), we transform it into zero (resp. 100).

Number of zombies We decided to limit the number of zombies to the number of empty spaces in the map because it would be suicidal to enter in a room with more zombies. Though, the zombie can still stand on a cell containing an item.

Moves The brave and the zombies are moving one after another. When the brave has make 2 moves, all the zombies can make 3 move at the same time and when they are done the brave can already move. Displacements and pickups are considered as moves while killing is not. We decided that the zombies destroy an item on in five when then can.

Pickups If the brave couldn't reach the number of objects needed (because the zombies have destroyed some) then the brave automatically loses.

Kills A brave automatically kills a zombie if he has at least one bullet and if the zombie his in the cell in front of him. However, if he is running out of bullets and if the zombie is facing him, the zombie will automatically kill him. Furthermore, the zombie automatically kills the brave if the brave is in the cell in front of him and isn't facing him.

1   Architecture and design

We identified some port objects that we would need. The main ones are the brave and the zombies (one port object per zombie). To interact with the map, we also decided to create one port object for each cell because it was quite effective. To manage the turns of the brave and the zombies, we also created a controller. The functions relative the each entities are in separated files. We also have a file for the management of the GUI and a file for the launch of the game. To implement the interactions between all the entities, we made state diagrams. Since the codes of the port objects are quite self speaking and always following the same pattern

```
case Mode
of Mode_1 then ...
      case Msg
      of Msg_1 then ....
      ...
      [] Msg_n then ...
      end
...
[] Mode_m then ...
end,
```

we will only briefly describe what each port object does.

1.1   Controller

The controller has to say to the brave and to the zombies when it is their turn. He knows when a zombie is dead so he doesn't warn him in this case. He also has to say when the brave couldn't win because there are to few objects left in the room.

1.2   Cell

room == grid of cells
states + responsibilities

1.3   Players

states + responsibilities
interaction between them Brave and zombies in contiguous cells :
- if bullets left then
- - if brave facing, brace wins and zombie dies
- - else if brave not facing then
- - - if zombie facing, brave dies and game over
- - - else nothing happens
(petits dessins)
fights do not count as turns (vital) and are executed automatically

1.3.1   Brave

depends on the player
no shooting
bullets no items, because of combats
no mandatory taking
door enabled if count equal or superior to goal
3 times : scout + enter + quit

1.3.2   Zombies

AI : try moving 3 turns in the same direction, destroy objects 20 % of the time, change direction
randomly if obstacle. If brave, attempt to kill her.
2 times : enter + quit, to avoid overlap between zombies playing in the same turn

2   Concurrency issues

synchronization of the turns between the brave and the zombies
synchronization between the zombies : not on the same cell

3   Miscellaneous

QTk? Parler des functors Choix : si messages non attendu on reste dans le même état

Conclusion

should fulfill the requirements and provide some help to survive
